-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 24 October 2007.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-28 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-6 and 9 is/are rejected.
- 7) ☒ Claim(s) 7, 8, and 10-28 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 24 October 2007 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Arguments

1. Applicant's arguments filed on 10/24/2007 have been fully considered but they are not persuasive.

Applicants' Argument: Applicants argue that Wang does not disclose or suggest that the scatterer coefficients determined can be used for equalizing and demodulating the data signals transmitted via a time-variant channel to a receiver.

Examiner's Response: Examiner asserts that Wang does not disclose that the data signal is equalized with the scatterer coefficients and then demodulated with them.

However, Wiedeman discloses a receiver apparatus comprising an equalizer and a demodulator, wherein the equalizer equalizes a Doppler frequency offset (interpreted as the first scatterer coefficient) for each correlated signal and the delay (interpreted as the second scatterer coefficient) of each of the correlated signals (see column 15, last paragraph). Wiedeman further discloses that the receiver includes circuitry for combining together all equalized correlated signals to provide a demodulator with a composite received signal (see column 15, last paragraph). It would have been obvious to one of ordinary skill in the art at the time of invention to modify Wang as suggested by Wiedeman in order to transmit the majority of the signal over the communication path (or paths) which are capable of conveying a highest quality signal (see column 16, first paragraph) and as the result increase the performance of the receiver.

Applicants' Argument: Applicants argue that there is no teaching or suggestion in Wiedeman's reference that a receiver receiving data signal transmitted via a single

carrier or a multi-carrier data-transmission on a time-variant channel can use the scatterer coefficients for equalizing and demodulating the received data signal.

Examiner's Response: In response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

Drawings

2. The drawings were received on 10/24/2007. These drawings are accepted.

Claim Rejections - 35 USC § 112

3. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 4 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. As to claim 4, limitation, the measurement of the scatterer coefficients ... is in the context of multi-carrier data transmission schemes for receiving known data sequences, is vague.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the

invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wang et al. ("Generation of scattering functions by computer simulation for mobile communication channels", Vehicular Technology Conference, 1996. 'Mobile Technology for the Human Race', IEEE 46th; Publication Date: 28 Apr-1 May 1996, Volume: 3, On page(s): 1443-1447 vol.3.), in view of Wiedeman et al. (hereafter, referred as Wiedeman) (US 5,796,760).

As to claim 1, Wang discloses a data signal transmitted via a time-variant channel to a receiver (see page 1443), wherein scatter coefficients including attenuation (see page 1444, left column), delay and Doppler frequency (see page 1444, right column) in the received data signal, which cause signal distortion in the channel, are measured in the receiver (see pages 1443 and 1444). Although Wang does not disclose that the signal is transmitted using a single-carrier or multi-carrier, in order to transmit the signals from transmitter to the receiver, inherently, there must be at least one carrier (single carrier). Wang discloses all the subject matters claimed in claim 1, except that the data signal is equalized with the scatterer coefficients and then demodulated with them. Wiedeman discloses a receiver apparatus comprising an equalizer and a demodulator, wherein the equalizer equalizes a Doppler frequency offset (interpreted as the first scatterer coefficient) for each correlated signal and the delay (interpreted as the second scatterer coefficient) of each of the correlated signals (see column 15, last paragraph). Wiedeman further discloses that the receiver includes circuitry for combining together all equalized correlated signals to provide a demodulator with a

composite received signal (see column 15, last paragraph). It would have been obvious to one of ordinary skill in the art at the time of invention to modify Wang as suggested by Wiedeman in order to transmit the majority of the signal over the communication path (or paths) which are capable of conveying a highest quality signal (see column 16, first paragraph) and as the result increase the performance of the receiver.

As to claim 3, Wang does not expressly disclose that the measurements have been taken place in the context of single-carrier data transmission schemes. However, in order to transmit the signals from transmitter to the receiver, inherently, there must be at least one carrier (single carrier).

5. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wang and Wiedeman, further in view of Borowski (US 3,997,841).

As to claim 2, Wang discloses that the measurement of the scatterer coefficients has been taken place in the time domain (see the abstract and page 1443, right column). Wang and Wiedeman disclose all the subject matters claimed in claim 2, except that the equalization of the data signal takes place within the time domain. Borowski discloses that the advantages of the time-domain equalizers are that sufficient noise suppression can be achieved, which permits the use of a low-noise amplifier with sufficient control range (see column 1, paragraph 4). Therefore, for the reasons stated above, it would have been obvious to one of ordinary skill in the art at the time of invention to modify Wang and Wiedeman to use a time domain equalizer to equalize the data signal.

6. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wang and Wiedeman, further in view of Schenk et al. (hereafter, referred as Schenk) (US 6,647,076).

As to claim 5, Wang discloses that the measurement of the scatterer coefficients has been taken place in the frequency domain (see the abstract and page 1443, right column). Wang and Wiedeman disclose all the subject matters claimed in claim 5, except that the equalization of the data signal takes place within the frequency domain. Schenk discloses that a frequency domain equalizer is used for the channel equalization of a signal vector (see column 5, lines 35-40). Schenk further discloses that the frequency domain equalizers require a smaller outlay on circuitry than time domain equalizers and can be implemented as a simple and fast algorithm and as a simple circuit (see column 2). Therefore, for the reasons stated above, it would have been obvious to one of ordinary skill in the art at the time of invention to modify Wang and Wiedeman to use a frequency domain equalizer to equalize the data signal.

7. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wang, Wiedeman, and Schenk, further in view of Schafhuber et al. (hereafter, referred as Schafhuber) (Adaptive prediction of time-varying channels for coded OFDM systems Schafhuber, D.; Matz, G.; Hlawatsch, F.; Acoustics, Speech, and Signal Processing, 2002. Proceedings. (ICASSP '02). IEEE International Conference on Volume 3, 13-17 May 2002 Page(s):III-2549 - III-2552 vol.3).

As to claim 6, Wang, Wiedeman, and Schenk disclose all the subject matters claimed in claim 6, except that the measurements of the scatterer-coefficients and the

equalization of the data signal is in the context of multi-carrier data transmission schemes. Schafhuber, in the same field of endeavor, teaches determining a scattering function (see page 2549, right paragraph), and therefore inherently the scatterer-coefficients, and the equalization of the data signal (see Fig. 2) in the context of multi-carrier data transmission schemes (i.e. the OFDM) (see page 2549). It would have been obvious to one of ordinary skill in the art at the time of invention to use the teachings of Wang, Wiedeman, and Schenk, to make the system disclosed by Schafhuber more simple and cost effective.

8. Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wang and Wiedeman, further in view of Ratnarajah et al. (hereafter, referred as Ratnarajah) (US 6,757,339).

As to claim 9, Wang and Wiedeman disclose all the subject matters claimed in claim 1, except that a first measurement of the scatterer coefficients is implemented with the assistance of a known data sequence. Ratnarajah discloses a method for estimating the sequence of transmitted symbols in a digital communication system (see the abstract). Ratnarajah discloses that the channel impulse response coefficients (i.e. interpreted as scatterer coefficients) are determined from training symbols embedded in the transmitted data sequence (See column 1, lines 37-49). It would have been obvious to one of ordinary skill in the art at the time of invention to modify Wang and Wiedeman as suggested by Ratnarajah, to more accurately determine the coefficients.

Allowable Subject Matter

9. Claims 7, 8, and 10-28 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

10. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Leila Malek whose telephone number is 571-272-8731. The examiner can normally be reached on 9AM-5:30PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mohammad Ghayour can be reached on 571-272-3021. The fax phone
